

ABSTRACT OF THE DISCLOSURE

Disclosed herein is a rotation-stop mechanism for a folder of a portable wireless terminal. The rotation-stop mechanism enables the folder to be opened away from the terminal body at various angles, according to the user's need, while smoothly maintaining

5 the opening and closing operation of the folder. The rotation-stop mechanism can stop the rotation of the folder in a state wherein the folder is opened away from the terminal body at an angle of or about 90°, according to the user's need, while allowing the folder to be smoothly opened away from or closed to the terminal body. Further, the folder can be freely opened away from the terminal body at angles of at or about 90° or at or about 150°.

10 Furthermore, in the case of the portable wireless terminal installed with a camera lens, since the folder can be firmly fixed when it is opened away from the terminal body at an angle of or about 90°, the portable wireless terminal is advantageous for stable image capturing and video communications.
